PERFORMANCE OF COMMERCIAL SOYBEANS IN ILLINOIS

THE UNIVERSITY OF ILLINOIS commercial soybean testing program was started in 1969 as a result of requests by seedsmen that their private varieties be tested. There were 338 conventional and 447 Roundup Ready® varieties from 59 seed companies tested in 2000.

The purpose of this commercial soybean testing program is to provide unbiased, objective, and accurate testing of all varieties entered. The tests are conducted on as uniform a soil as is available in the testing area. Small plots are used to reduce the chance of soil and climatic variations occurring between one variety plot and another.

The results of these tests should help you judge the merits of varieties in comparison with other private and public varieties. Because your soils and management may differ from those of the test location, you may wish to plant variety strips of the higher-performing varieties on your farm. The results printed in this circular should help you decide which varieties to try.

TEST PROGRAM

Selection of entries. Soybean producers in Illinois and surrounding states were invited to enter varieties, brands, or blends in the 2000 Illinois soybean performance trials. Entrants were required to enter all nonirrigated, 30-inch-row-width trials on a regional basis. To help finance the testing program, a fee of \$70 (\$75 for Roundup Ready®) per location was charged for each entry entered by the seed producer. Most of these varieties, brands, or blends are commercially available, but some experimental varieties were also entered. A total of 3,073 entries were tested in 2000.

Number and location of tests. In 2000, tests were conducted at 12 locations in the state (see map). These sites represent the major soils and maturity zones of the state.

Nonirrigated, 30-inch-row-width trials conventional and Roundup Ready® were conducted on a regional basis. The regions are as follows:

- Region I DeKalb and Erie
- Region II Monmouth, Goodfield and Dwight
- Region III Perry, New Berlin and Urbana
- Region IV Brownstown and Belleville
- Region V Carbondale and Dixon Springs

Seven-inch-row-width both conventional and Roundup Ready® trials were conducted at Urbana.

Field plot design. Entries of each test were replicated three times in a randomized complete block or alpha lattice design. The 30-inch-row trial plots consisted of four rows, each 21 feet long. The center two rows of each plot were harvested to measure yield. The 7-inch-row trial plots consisted of eight rows, each 21 feet long. The center six rows were harvested to measure yield.

Fertility and weed control. All test locations were at a high level of fertility. Herbicides were used at all test locations for weed control. Weed control for the Roundup Ready® trials consisted of post-emergence applications of Roundup as needed, **no pre-emergence herbicide was used.** All plots were also weeded by hand.

Method of planting and harvesting. The 30-inch-row variety trials were planted with a modified bean planter. A custom-built, cone type, narrow-row drill was used to plant the 7-inch trials. Harvesting was done with a small-plot combine. No allowances

were made for beans that may have been lost as a result of combining or shattering.

Soybean Cyst Nematode. Soil samples were taken from variety plots at each location in August and evaluated for cyst populations. Threshold numbers of cysts per 100cc of soil are as follows:

Low	1-5
Medium	6-25
High	>25

PERFORMANCE DATA

Yield. Soybean yield was measured in bushels (60 pounds) per acre at a moisture content of 13 percent. An electronic moisture monitor was used on the combine for all moisture readings.

Maturity. Maturity was stated as the date when approximately 95 percent of the pods were ripe.

Lodging. The amount of lodging was rated at harvest time. The following scale was used:

- 1 - Almost all plants erect
- 2 - All plants leaning slightly or a few plants down
- 3 - All plants leaning moderately (45°), or 25 to 50 percent of the plants down
- 4 - All plants leaning considerably, or 50 to 80 percent of the plants down
- 5 - Almost all plants down

Height. Height was measured shortly before harvest as the average length of plants from the ground to the tip of the main stem.

Shattering. The percentage of open pods was estimated at harvest time. The following scale was used:

- 1 - No shattering
- 2 - 1 to 10% of pods open
- 3 - 10 to 25% of pods open
- 4 - 25 to 50% of pods open
- 5 - Over 50% of pods open

* No shattering was observed in the 2000 trials, therefore, this data will not appear in the tables.

SUGGESTIONS FOR COMPARING ENTRIES

It is impossible to obtain an exact measure of performance when conducting any test of plant material. Harvesting efficiency may vary, soils may not be uniform, and many other conditions may produce variability. Results of repeated tests are more reliable than those of a single year or a single-strip test. When one variety consistently out yields another at several test locations and over several years of testing, the chances are good that this difference is real and should be considered in selecting a variety. However, yield is not the only indicator. You should also consider maturity, lodging, plant height and shattering.

As an aid in comparing soybean varieties, brands, and blends within a single trial, certain statistical tests have been devised. One of these tests, the least significant difference (L.S.D.), when used in the manner suggested by Carner and

Swanson¹ is quite simple to apply and is more appropriate than most other tests. When two entries are compared and the difference between them is greater than the tabulated L.S.D. value, the entries are judged to be "significantly different."

The L.S.D. is a number expressed in bushels per acre and presented following the average yield for each location. An L.S.D. level of 25% is shown. Find the highest yielding soybean variety within the regional table or single location table of interest, subtract the 25% L.S.D. value from the highest yielding variety, every variety with a greater yield than the resulting number is 'statistically the same' as the highest yielding variety. Consider the merits of the varieties in this group when making varietal selections.

In a study of the frequencies of occurrence of three types of statistical errors and their relative seriousness, Carmer² found strong arguments for an optimal significance level in the range $\alpha = 0.20$ to 0.40 , where α is the Type I statistical error rate for comparisons between means that are really equal. Herein, a value of $\alpha = 0.25$ is used in computing the L.S.D. 25-percent level shown in the tables.

To make the best use of the information presented in this circular and to avoid any misunderstanding or misrepresentation of it, the reader should consider an additional caution about comparing entries. Readers who compare entries in different trials or row spacings should be extremely careful, because no statistical tests are presented for that purpose. Readers should note that the difference between a single entry's performance at one location or row spacing and its performance at another is caused primarily by environmental effects and random variability. Furthermore, the difference between the performance of entry A in one trial or row spacing and the performance of entry B in another trial or row spacing is the result not only of environmental effects and random variability, but of genetic effects as well.

2000 SOYBEAN LOCATIONS

2000 TEST FIELDS

Erie

Location: Slaymaker farm, Whiteside Co., west of Rock Falls.
 Soil Type: Beaucoup silty clay loam.
 Cooperator: Robert Slaymaker.
 Planting Date: May 5.
 Harvest Date: October 12.
 Herbicide: PRE-Boundary, Post-FirstRate, Poast
 Roundup trial: Post-Roundup
 Tillage: fall chisel, spring field cultivate.
 S.C.N.: low.

DeKalb

Location: University of Illinois, Northern Illinois Agronomy Research Center, DeKalb County, southwest of DeKalb.
 Soil type: Flanagan silt loam (dark brown, adequately drained, highly fertile).
 Cooperators: Lyle Paul, agronomist; Dave Lindgren, foreman.
 Planting date: May 4.
 Harvest dates: October 3.
 Herbicide: PPI- Dual II Magnum, Post-Classic, Pinnacle, Assure II.
 Roundup trial: Post- Roundup.
 Tillage: fall plow, spring mulch finisher.
 S.C.N.: none.

Goodfield

Location: Wurmnest farm, Woodford county, north of Goodfield, central Illinois.
 Cooperator: Mike Wurmnest.
 Soil Type: Ipava silt loam.
 Planting date: May 3.
 Harvest date: September 22 & October 2.
 Herbicide: PRE- Boundary, Post-FirstRate, Poast.
 Roundup trial: Post- Roundup
 Tillage: fall chisel, spring field cultivate.
 S.C.N. low.

Dwight

Location: Livingston County, Zabel Farm.
 Soil type: Elliott silty clay loam.
 Cooperator: Larry Zabel.
 Planting date: May 5.
 Harvest dates: September 27 & October 2.
 Herbicide: PRE- Boundary, Post- FirstRate, Poast
 Roundup trial : Post- Roundup
 Tillage: fall chisel, spring field cult.
 S.C.N.: none.

Monmouth

Location: University of Illinois, Northwestern Illinois Agricultural Research and Demonstration Center, Warren County, northwest of Monmouth.

Soil type: Muscatine silt loam.

Cooperators: Eric Adee, agronomist; Martin Johnson, foreman.

Planting date: May 3.

Harvest dates: September 19 & 29.

Herbicide: PRE- Pursuit, Post-FirstRate, Poast

Roundup trial: Post- Roundup.

Tillage: fall chisel & spring Dyna-Drive

S.C.N.: Roundup trial-none, Conventional trial-low.

Urbana

Location: University of Illinois, Crop Sciences Research & Education Center, Champaign County, east central Illinois.

Soil type: Flanagan silt loam (dark brown, adequately drained).

Cooperators: Robert Dunker, agronomist; Mike Kleiss, foreman.

Planting dates: May 6.

Harvest dates: Sep 21 & Oct 1, 11 & 13

Herbicide: PRE-Boundary, Post-FirstRate, Poast.

Roundup trial: Post- Roundup.

Tillage: fall chisel, spring field cult.

S.C.N.: low.

Perry

Location: Orr Agricultural Research and Demonstration Center, near Perry, Pike County, west central Illinois.

Soil type: Rozetta silt loam.

Cooperators: Glenn Raines, agronomist; Mike Vose, foreman.

Planting date: May 2.

Harvest dates: September 18 & 28.

Herbicide: PRE- Gramoxone Extra, Dual II Magnum, Pursuit. Post- Poast Plus, FirstRate

Roundup trial: Burn-Down- Gramoxone Extra. Post- Roundup Ultra.

Tillage: fall deep chisel, spring disk-harrow

S.C.N.: medium.

New Berlin

Location: King farm, Sangamon county, north of New Berlin, Central Illinois.

Cooperator: Ike King.

Soil type: Sable silty-clay loam.

Planting date: May 2.

Harvest date: September 18 & 30.

Herbicide: PRE-Boundary, Post-FirstRate, Poast.

Roundup trial: Post-Roundup.

Tillage: fall chisel, spring field cultivate.

S.C.N. low.

Brownstown

Location: University of Illinois, Brownstown Agronomy Research Center, Fayette County, south central Illinois.

Soil type: Cisne silt loam (poorly drained, gray prairie with a well-developed claypan).

Cooperators: Adam Anderson, research director; Lindell Deal, field worker.

Planting date: May 16.

Harvest dates: October 4 & 11.

Herbicide: PPI- Treflan, Post- Raptor & Flexstar, Reflex & Fusion.

Roundup trial: Post- Roundup.

Tillage: spring disk, disk, mulch.

S.C.N.: none.

Belleville

Location: Southern Illinois University Research Center, east of Belleville, St. Clair County.

Soil type: Conventional, Weir silt loam. Roundup, Herrick silt loam.

Cooperators: Dr. Ed Varsa, research director; Ron Krausz, field manager.

Planting date: May 11.

Harvest date: October 9.

Herbicide: PPI- Triscept+Treflan.

Roundup trial: Post- Roundup.

Tillage: fall chisel, spring disk, & cultimulcher.

S.C.N.: Roundup, none. Conventional,low.

Carbondale

Location: Oval Myers farm, north of Carbondale, Jackson County, extreme southern Illinois.

Soil type: Weir silt loam (shallow, silty loam over claypan).

Cooperators: Dr. Ed Varsa, research director; Paul Pinnon, field manager.

Planting date: June 1.

Harvest dates: October 10 & 19.

Herbicide: PRE- Squadron.

Roundup trial: Post- Roundup.

Tillage: spring disk & field cultivate.

S.C.N.: low.

Dixon Springs

Location: University of Illinois Dixon Springs Agricultural Center, Pope County, extreme southern Illinois.

Soil type: Belknap silt loam (light-colored, moderately well-drained, medium-textured bottomland).

Cooperators: Steve Ebelhar, agronomist; Carl Hart, research specialist.

Planting date: May 15.

Harvest dates: September 20 & October 5, 19.

Herbicide: PRE- Broadstrike/Dual, Post- Flexstar+Fusion.

Roundup trial: Post- Roundup.

Tillage: DMI Ecolo-til (primary tillage), spring disk.

S.C.N.: low.
